## ABOUT

I'm a first-year CS student who got a bit obsessed with systems programming. I write mostly Rust and Go, and a good chunk of my free time goes into reading other people's codebases just to understand how things are built. I started contributing to open source because I wanted to get better, and it kind of snowballed from there. On the side I'm co-founding Klyna.io and maintaining mohu-org, which I started because I wanted NumPy but in Rust and figured the best way to get it was to build it myself.

## EDUCATION

**Medhavi Skills University, India** 2025 – Present  
*B.Tech in Computer Science (AI/ML), 1st Year*

## EXPERIENCE

**Klyna.io** *Co-founder, 2025 – Present*

- Started this with a friend because we kept hitting the same wall: API monitoring tools were either way too heavy or didn't actually tell you anything useful. So we built the thing we wished existed.
- I own the backend end to end. Ingestion pipeline, alerting engine, and the REST API. Stack is Rust, PostgreSQL, and Redis. We built the React dashboard together.

**mohu-org** *Maintainer, 2025 – Present*

- Wanted a NumPy-style library that was actually native to Rust, not a wrapper. So I started building one: Arrow-native storage, SIMD compute kernels, linear algebra covering matmul, LU, QR, SVD, and Cholesky.
- Added Python bindings via PyO3 so it works from data science workflows without a serialization penalty.

**MoFA (mofa-org/mofa)** *Collaborator, 2025 – Present*

- Been contributing to this Rust AI agent framework for a while. 21 merged PRs covering trait design, core implementations, and a Cognitive Gateway prototype I put together on a demo branch to test the ideas end to end.

## OPEN SOURCE CONTRIBUTIONS

| Organisation                 | Contributions                                                                                                                                                                                                                    | PRs              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>mofa-org/mofa</b>         | Kernel traits (GatewayRoute, AuthProvider, StructuredOutput, VectorStore), foundation implementations (AgentBuilder, RAG pipeline, rate limiter, built-in tools), 10 gateway phases, working prototype on demo/gateway-live-demo | <b>21 merged</b> |
| <b>LLVM</b>                  | Compiler passes and IR tooling across the LLVM core codebase                                                                                                                                                                     | <b>11 merged</b> |
| <b>CNCF Inspektor Gadget</b> | eBPF-based observability tooling; first CNCF contribution                                                                                                                                                                        | <b>3 merged</b>  |
| <b>erof-utils</b>            | Utility library patch                                                                                                                                                                                                            | <b>1 merged</b>  |

## PROJECTS

| Project                 | Stack            | What it is                                                                                                                                                                                                                                                       |
|-------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mohu-org</b>         | Rust, PyO3, SIMD | NumPy replacement built in pure Rust. Arrow-native storage, SIMD compute kernels, linear algebra primitives (matmul, LU, QR, SVD, Cholesky), and zero-copy Python bindings via PyO3. Started it because I wanted it to exist and nothing else hit the right bar. |
| <b>binrs</b>            | Rust             | A small CLI for working with binary data across different encodings. Wrote it after getting tired of doing conversions by hand. Handles binary, hex, octal, BCD, Gray code, Base64, and run-length encoded bitstreams.                                           |
| <b>Go Git</b>           | Go               | A complete Git implementation in Go, built to understand how Git actually works internally. Covers the full object model, pack files, refs, and commit graph traversal. Reading the internals docs while building it was genuinely interesting.                  |
| <b>Shell in Rust</b>    | Rust             | A Unix shell written in Rust for the same reason as Go Git: I wanted to understand the internals rather than just use the thing. Has job control, piping, signal handling, and built-in command resolution.                                                      |
| <b>Go Bank</b>          | Go, PostgreSQL   | A double-entry banking system in Go. The goal was getting the financial logic airtight: every transaction has a matching debit and credit, and the audit ledger lets you reconstruct account state at any point.                                                 |
| <b>License Detector</b> | Python, ML       | ML-based tool for spotting open source license violations across large codebases. Useful for teams pulling in a lot of third-party code who need to stay clean on licensing obligations.                                                                         |

## SKILLS

|                   |                                                                                        |
|-------------------|----------------------------------------------------------------------------------------|
| <b>Languages</b>  | Rust, Go, C++, Python, TypeScript, JavaScript                                          |
| <b>Async Rust</b> | Tokio, Axum, Ractor, SQLx                                                              |
| <b>LLVM</b>       | Compiler passes, LLVM IR, TableGen, MLIR, opt/lc, C++ internals                        |
| <b>Systems</b>    | Plugin architectures, microkernel design, WebAssembly, Rhai, SIMD                      |
| <b>ML / AI</b>    | NumPy, pandas, scikit-learn, TensorFlow, PyTorch, deep learning, RAG, LLM APIs, Qdrant |
| <b>Infra</b>      | PostgreSQL, Redis, Docker, Kubernetes, GitHub Actions, Linux                           |
| <b>Web</b>        | React, Vite, Node.js, REST, WebSockets                                                 |

## HOBBIES

|                    |                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Anime</b>       | Watch a lot of it. Drawn to series with dense world-building or unusual narrative structure.                                    |
| <b>Codebases</b>   | I read other people's code the way some people read novels. Something satisfying about tracing how a big system holds together. |
| <b>Pop Science</b> | Reading whatever catches my eye. Mostly physics and biology, no hard rules.                                                     |
| <b>Physics</b>     | Pure curiosity, no formal study. I like sitting with something until it clicks, from classical mechanics out to cosmology.      |
